

CELESTIA INTERIOR & EXTERIOR DESIGNS

PROJECT REPORT SUBMITTED IN PARTIAL FULFILMENT OF THE
REQUIREMENTS FOR THE AWARD OF

BACHELOR OF COMPUTER APPLICATIONS

To

MARIAN COLLEGE KUTTIKKANAM [AUTONOMOUS]

Affiliated to

MAHATMA GANDHI UNIVERSITY, KOTTAYAM

By

SHEETHAL S

(Reg.No:22UBC257)

DERIN JACOB BABU

(Reg.No:22UBC222)

Guided By

Ms. SHEELA S

DEPARTMENT OF COMPUTER APPLICATIONS
MARIAN COLLEGE KUTTIKKANAM (AUTONOMOUS)

PEERMADE – 685531

OCTOBER, 2024

DECLARATION

We, **SHEETHAL S [Reg.no 22UBC257], DERIN JACOB BABU [Reg.no 22UBC222]** certify that the Mini project report entitled “**CELESTIA INTERIOR & EXTERIOR DESIGNS**” is an authentic work carried out by us at Marian College Kuttikkanam(Autonomous). The matter embodied in this project work has not been submitted elsewhere for the award of any degree or diploma to the best of our knowledge and belief.

Signature of the Students:

SHEETHAL S

DERIN JACOB BABU

Date:

BONAFIDE CERTIFICATE

This is to certify that this project work entitled “**CELESTIA INTERIOR & EXTERIOR DESIGNS**” is a bonafide record of work done by **Ms. SHEETHAL S [Reg.no 22UBC257], Mr. DERIN JACOB BABU [Reg.no 22UBC222]** at Marian College Kuttikkanam (Autonomous) in partial fulfilment for the award of the **Degree of Bachelor of Computer Applications of Mahatma Gandhi University, Kottayam.**

This work has not been submitted elsewhere for the award of any degree to the best of our knowledge.

Head of the Department

Dr Rajimol A

EXTERNAL EXAMINER

ACKNOWLEDGEMENT

“Gratitude is a feeling which is more eloquent than words, more silent than silence.” In undertaking this project, we needed the direction, assistance and cooperation of various individuals and organizations, which is received in abundance with grace of God, without their unconstrained support, the project could not have been completed. If words are considered as the symbol of approval and token of acknowledgement, then let the following words play the heralding role of expressing our gratitude.

We wish to acknowledge our sincere gratitude to our Manager, **Rev.Fr. Bobby Alex Mannamplackal** and **Dr Ajimon George**, Principal **Marian College Kuttikkanam (Autonomous)**, for all their efforts and administration in educating us in their premier institution.

We extend our gratitude to **Dr Rajimol A**, Head of the Department of Computer Application, who is a constant source of inspiration and whose advice helped us to complete this project successfully. We express our deep sense of gratitude to our internal project guide, **Ms Sheela S**, for her profound guidance for the successful completion of this project. With great enthusiasm we express our gratitude to all the faculty members of Department of Computer Applications for their timely help and support.

Finally, we express our deep appreciation to all our friends and family members for the moral support and encouragement they have given to complete this project successfully.

Derin Jacob Babu, Sheethal S

ABSTRACT

ABSTRACT

The project named “Celestia Interior and Exterior Design” is a web-based platform for discovering, planning, and executing design projects. Celestia's streamlined processes make designing and decorating spaces more accessible and convenient, offering essential tools for both users and design professionals in the digital era. The system mainly consists of two modules: Users and Admins. Users can explore trendy design ideas, purchase products, and hire professionals. They can view detailed design information, book virtual or in-person consultations with design experts. The platform also allows users to track their purchase history for easy reference.

Admins can oversee consultations, and manage website content and payments. Admins have the ability to ensure that consultations are scheduled efficiently. Additionally, the platform supports secure payment processing and real-time notifications to keep users informed about their bookings and purchases.

The platform uses HTML, CSS, and JavaScript for the front end, providing an intuitive user interface. The back end, developed with PHP and MySQL, ensures robust data management and seamless functionality.

INTRODUCTION

1.INTRODUCTION

1.1 ABOUT THE PROJECT

The Celestia Interior & Exterior Design Website is a digital platform tailored to connect users with interior and exterior design solutions. It provides a comprehensive suite of features for users to explore trendy design ideas, purchase products and book consultations with design experts. The website's user-friendly interface ensures a smooth navigation experience, allowing users to easily view detailed design information, and connect with design professionals for inquiries and support.

1.1.1 THE PURPOSE AND SCOPE

The primary purpose of the Celestia Interior & Exterior Design Website Project is to establish an efficient and convenient online platform for interior and exterior design solutions. The project aims to provide a centralized hub where users can discover design ideas, purchase products, book consultations, and interact with design professionals seamlessly. The scope of the project includes:

- Enabling users to explore and filter design ideas.
- Empowering users to purchase products directly from the platform with detailed product information, including images and descriptions..
- Facilitating user inquiries and support through a contact form.
- Implementing admin functionalities to manage product listings, consultations, customer support.

1.2 EXISTING SYSTEM

In the current scenario, accessing interior and exterior design solutions often involves fragmented and time-consuming methods. Users typically rely on physical interactions, limited design catalogs, and scattered communication channels with design professionals. This manual approach can lead to inefficiencies, delays, and limited access to design resources.

1.3 PROPOSED SYSTEM

The main objective of the proposed Celestia Interior & Exterior Design Website is to eliminate the limitations of the existing manual system and make it more user-friendly. Most of the

limitations of the current system can be overcome by the proposed system. Speed and accuracy are the main advantages of the proposed system, with no redundancy of data. The proposed software requires fewer resources to manage the entire design platform. Since all details are stored digitally, searching time is reduced. Information can be more secure because computer systems provide better data security. The proposed system eliminates many drawbacks of the existing system and enhances data security, user experience, and operational efficiency.

SYSTEM ANALYSIS

2. SYSTEM ANALYSIS

2.1 PROBLEM DEFINITION

The current system does use digital solutions for interior and exterior design needs, but it lacks refinement. Even when records are kept digitally, they are often managed inefficiently and are not integrated with the internet. This makes it difficult to handle various aspects like user interactions, product management, and consultations efficiently. Much of the record-keeping and scheduling are still done manually, leading to errors and delays. To overcome these limitations, the Celestia Interior & Exterior Design Website is proposed.

2.1.1 ADVANTAGES OF PROPOSED SYSTEM

- **Avoids Redundancy:** The system uses various types of validation to eliminate redundancy, enhancing overall efficiency.
- **Quick Access and Processing:** The proposed system offers faster access and processing, making it more efficient than the existing system.
- **Time Efficiency:** The new automated system significantly reduces time consumption compared to the existing manual system.
- **Reduces Paperwork:** The system minimizes the need for paperwork, streamlining operations.
- **Provides Accurate Information:** The system ensures the accuracy of information, improving reliability and decision-making.

2.2 FEASIBILITY ANALYSIS

Feasibility study is a test of a system proposal according to its workability, ability to meet user needs and effective use of resources. The objective of feasibility is not to solve the problem but to acquire a sense of its scope. The main aim of the feasibility study is to test the technical, social and economic feasibility of the system. The feasibility study can be classified into the following categories:

- Operational Feasibility
- Technical Feasibility

- Economic Feasibility

2.2.1 OPERATIONAL FEASIBILITY

The proposed system offers user friendliness combined with greater processing speed. Therefore, the work done can be reduced. Since the processing speed is very high compared with manual system a lot of time can be saved. The workload is reduced and this system requires only a small amount of work from Admin who manages the whole system. Hence, this project is operationally feasible.

2.2.2 TECHNICAL FEASIBILITY

Technical feasibility deals with hardware as well as software requirements and to what extent it can support the proposed system. The hardware required is an android phone and software is Android Studio. If the necessary requirements are made available with the system, then the proposed system is said to be technically feasible.

2.2.3 ECONOMIC FEASIBILITY

Economic feasibility is an important factor. Since the existing system is manual on the feasibility for wrong data entry is higher and consumes a lot of time and can occur errors. But the proposed system aims at processing of information's efficiently, thus saving the time. The new system need only a system and which is already available therefore the cost is negligible. Proposed system uses validation check so there are no errors. Even though an initial investment has to be made on the software and the hardware aspects, the proposed system aims at processing of information's efficiently. Thus, the benefits acquired out of the system are sufficient enough for the project to be undertaken. So, the proposed system is economically feasible.

2.3 RECOMMENDED IMPLEMENTATIONS

Two principle sources of data are:

- Written documents
- Data from the persons, who are involved in the operation of the system under study.

The different fact-finding techniques are:

- Questionnaires

- Personal Interviews
- Observations

Questionnaires

Questionnaires are best methods to probe data out of the customers. In this case, questionnaires were not used for data collection as the administration was small in number and they could be asked questions in a more effective interview.

Personal Interviews

Personal interviews are the best way to gather facts. This was the primary source of fact finding used for this project. The owner and the employees were interviewed and data collected. They were asked how the administrative duties and record keeping happened under the existing system. And suggestions were taken on what they wanted to add in addition in this system. Almost all their suggestions were integrated into this project.

Observations

A person can understand a lot about a system just by observing it. By being a bystander and observing how a day passes in the real estate helped to kick off this project. Using this method resulted in a better understanding of the workings of the organisation and what to do to make this an web application. Observing the current system, one can understand that a lot of paperwork and staff services involved in the administrative and distribution area. The way in which the records are kept gives an idea for a strong database model.

SOFTWARE REQUIREMENT SPECIFICATIONS

3. SOFTWARE REQUIREMENT SPECIFICATION

3.1 INTRODUCTION

Requirements specification is the starting step for the development activities. It is currently one of the weak areas of software engineering. During requirement specification, the goal is to produce a document of the client's requirements. This document forms the basis of development and software validation. The basic reason for the difficulty in software requirements specification comes from the fact that there are three interested parties- the client, the end users and the software developer.

3.2 PURPOSE

The origin of most software systems is in the need of a client, who either wants to automate an existing manual system or desires a new software system. The software system itself is created by the developer. Finally, the completed system will be used by the end users. Thus, there are three major parties interested in a new system: the client, the users and the developer. A basic purpose of software requirements specification is to bridge the communication gap. SRS is the medium through which the client and user needs are accurately specified. Indeed, SRS forms the basis of software development. A good SRS should satisfy all the parties, something very hard to achieve, and involves trade-offs and persuasion.

Another important purpose of developing an SRS is helping the clients understand their own needs. Advantages are:

- An SRS establishes the basis for agreement between the client and the supplier on what the software product will do
- An SRS provides a reference for validation of the final product
- A high-quality SRS is a prerequisite to high-quality software.
- A high-quality SRS reduces the development cost.

3.3 SCOPE

3.3.1 SYSTEM STATEMENT OF SCOPE

The Celestia Interior & Exterior Design Website was developed to provide a platform for discovering, planning, and executing interior and exterior design projects. The system further offers features such as purchasing products, booking consultations, and saving favorite designs. Reports can be generated to retrieve data.

3.4 TECHNICAL OVERVIEW

3.4.1 USER CHARACTERISTICS

The system can be accessed by two types of users: Admin and User. Admins have access only to the admin dashboard, while users have access to the site and all its services. The admin functionalities are invisible to users.

3.5 FUNCTIONAL REQUIREMENTS

The functional requirements of this website are as follows:

1. User Management:

- **User Registration Process:**

Users provide essential details like name, email, and password.

- **User Authentication:**

- Users log in by entering their registered email and password.
- The system verifies credentials against stored data to allow access.
- Users can securely log out, ending their active sessions to prevent unauthorized access.

2. Design Idea Management:

- Users can explore and view trendy design ideas.

- Users can purchase design-related products directly from the platform.

3. Consultation Management:

- Users can book virtual or in-person consultations with design experts.
- Admins can manage and oversee consultation bookings, ensuring efficient scheduling.

4. Product Management:

- Admins can add new design-related products, edit existing product information, and remove items as needed.
- Admins can upload, edit, or remove product images to ensure accurate representation.

5. Cart Management:

- Users can add or remove products from their cart.
- The cart automatically updates quantities and total prices.
- Users can view a summary of their cart, including item details and total cost.

6. Order Management:

- The system collects all billing information during checkout.
- Essential order details, such as product information, quantity, and customer details, are stored.

7. Purchase History:

- Users can view their purchase history, including product details, quantities, prices, and order dates.
- Users can track their past orders conveniently.

8. Admin Dashboard:

- Admins can oversee consultations.
- Admins can manage website content, payments, before publication.
- Admins can monitor and ensure efficient consultation scheduling.

3.6 NON-FUNCTIONAL REQUIREMENTS

The non-functional requirements of this website are as follows:

1. Usability:

- Intuitive and user-friendly interface.
- Comprehensive design features and clear navigation.

2. Reliability:

- System performs reliably in 95% of use cases monthly.
- Ensure consistent and accurate data processing.

3. Availability:

- Accessible globally 24/7.
- Backup and recovery mechanisms to restore service within an hour of a failure.

4. Security:

- Hourly backups of the database.
- Secure handling of user data to protect privacy and prevent unauthorized access.

5. Performance:

- Quick response times and minimal latency.
- Efficient handling of large volumes of data.

6. Scalability:

- Capable of supporting a growing number of users and transactions.
- Modular architecture to facilitate easy expansion.

7. Maintainability:

- Codebase should be well-documented and modular for ease of updates and bug fixes.
- Regular maintenance schedules to ensure system health and performance.

3.7 STATED REQUIREMENTS

3.7.1 GENERAL REQUIREMENTS

The system has 7 functional modules divided between admin and users.

1. Login

- Only registered users and admins can log in to the system to avail the services.
- The registered users and admins use their ID and password to log in.
- The user ID should always be a valid email ID.
- The password can contain both uppercase and lowercase alphabetic characters, numbers, and special characters.
- Admins will be redirected to the admin panel when logging in with the predefined ID and password using the same login form.
- Users will be directed to the home page of the site when the login is successful.

2. Sign Up

- New users need to register in order to use the platform's services.
- This includes several fields:
 - First Name
 - Last Name
 - Email Address
 - Phone Number
 - Password
 - Confirm Password

3. Admin Panel

The admin panel contains different admin processes such as:

- Overseeing consultations
- Managing website content
- Managing payments

4. Explore Design Ideas

Users can browse through various design ideas and inspirations.

5. Purchase Products

Users can buy products listed on the platform.

6. Booking Services

- Users can book various services offered on the platform.
- Users can manage their bookings and view booking details.

7. Booking Consultations

- Users can schedule consultations with design experts.
- Users can manage their consultation appointments.

3.7.2 INPUTS

The Celestia platform will take various inputs to provide its services:

- **User Registration:**
 - First Name, Last Name
 - Email Address
 - Phone Number
 - Password, Confirm Password
- **Login:**
 - Email Address (User ID)
 - Password
- **Service Booking:**
 - Selected Service
 - Preferred Booking Time
- **Consultation Booking:**
 - Consultation Type (Virtual/In-person)
 - Preferred Consultation Time

3.7.3 PROCESSING

The system will perform the following key processing tasks:

- **Data Validation:**
 - Validate email format and password complexity.
 - Ensure required fields are not empty.
- **Service and Consultation Management:**
 - Users book and manage services and consultations.
 - Admins oversee bookings and consultations.
- **Content Management:**

Admins update and manage website content.

- **E-commerce:**
 - Users add products to cart, place orders, and track order history.
 - Secure payment processing.

3.7.4 OUTPUTS

The system produces the following outputs:

- **Product and Design Details:**
 - Product Name, Description
 - Design Ideas
- **Booking and Consultation Details:**

Confirmed booking and consultation details
- **Order and Payment Confirmation:**

Order details, payment confirmation.

3.8 EXTERNAL INTERFACE REQUIREMENTS

3.8.1 USER INTERFACES

All user interfaces will be GUI interfaces, designed for ease of use and high functionality. The interfaces will have a pleasing appearance and intuitive design.

- **Design and Appearance:**

- The interface will use suitable design elements and pleasing colors to create a comfortable and attractive environment for users.
- Consistent design themes will be maintained across all pages.

- **Usability Components:**

- Textboxes, combo boxes, and buttons will be used to facilitate easy data entry.
- Clear labels and instructions will be provided for all input fields.
- Intuitive navigation elements will help users move seamlessly through the platform.

- **Responsive Design:**

The user interface will be responsive to ensure usability across various devices, including desktops, tablets, and smartphones.

3.8.2 HARDWARE INTERFACES

The system needs a computer or any other smart devices with network availability to access the web application. No other external hardware is required.

Hardware Specification

- **Processor:** Intel Pentium or higher
- **RAM:** 256 MB or higher
- **Hard Disk Drive:** 100 MB required on disk
- **Keyboard:** Standard QWERTY keyboard

Implementation Specification

- **Operating System:** Windows OS

3.8.3 SOFTWARE INTERFACES

Software Specification

- **Operating System:** Windows 11
- **DBMS:** MySQL
- **Tool Used:** PHP

SYSTEM DESIGN

4. SYSTEM DESIGN

4.1 INTRODUCTION

The design phase aims to develop a solution for the problems identified during the analysis phase. This phase marks the transition from understanding the problem to creating a solution. System design details the required features and operations, including screen layouts, business rules, process diagrams, pseudocode, and other relevant documentation.

During this phase, the overall structure and specifics of the software are defined. This includes determining the number of tiers needed for the architecture, designing inputs and outputs, and establishing database and data structure designs. Proper analysis and design are critical to the development cycle since errors in this phase can be costly to fix later. Therefore, careful attention is given during the design phase.

The logical framework of the product and its physical attributes are outlined during this stage. The operating environment is set up, and key resources are identified. Any element that requires user input or approval must be documented and reviewed by the user. The physical aspects of the system are specified, and a detailed design is prepared.

Subsystems identified during design are used to create a detailed system structure. Each subsystem is divided into one or more design units or modules, and detailed logic specifications are created for each module. The module logic is typically described in a high-level design language, which is independent of the final implementation language.

A good design should consider:

- **Promptness:** The design should be straightforward and clear, guiding users to their desired outcomes intuitively.
- **Memory Load:** Research shows that users can retain about six words in their short-term memory. The number of choices presented to users should ideally be four or fewer to prevent confusion and forgetfulness.
- **Service Reachability:** Users dislike going through many steps to access a service. More than five steps can cause impatience, so minimizing the number of steps helps reduce frustration.

- **Navigation:** Users should easily navigate back and forth between different steps, allowing them to access various parts of the dialog seamlessly.
- **Phonetic Similarity:** Avoid choices with similar pronunciations to reduce confusion and ensure users can clearly distinguish between options.
- **Error Handling:** Implementing graceful error handling helps decrease dependency on operators by managing mistakes effectively.
- **User Updates:** Keep users informed about the ongoing process to maintain their engagement and understanding.

For the general design, one or more potential designs are proposed and broadly sketched. These alternatives are then presented to the users, who choose the design that best suits their requirements while staying within project constraints.

The detailed design stage specifies the user interface, database, programs, hardware, and training and system documentation. Several structured techniques are used during the design phase. To design the software components, the designer transforms the automated processes in the physical data flow diagram into a program structure chart, which decomposes software processes into detailed modules and shows control paths between modules.

4.2 DESIGN METHODOLOGY

4.2.1 INPUT DESIGN

Input design focuses on converting user-oriented inputs into a format recognizable by the computer. Collecting input data is one of the most costly parts of the system in terms of equipment, time, and user involvement. The goal of input design is to make data entry as simple, logical, and error-free as possible.

Input design serves as the bridge between the information system and its users, transforming transaction data into a form suitable for processing. This process can involve reading data from printed documents or directly keying data into the system. Effective input design controls the amount of input required, minimizes errors, avoids delays and extra steps, and keeps the process straightforward.

System analysis determines the following input design details:

- **What data to input**
- **What medium to use**
- **How the data is arranged and coded**
- **Data items and transactions requiring validation to detect errors**

Activities involved in input design include:

- **Data Recording:** Collecting data for input.
- **Data Verification:** Ensuring the accuracy of the collected data.
- **Data Conversion:** Transforming data into the required format.
- **Data Validation:** Checking data for errors.
- **Data Correction:** Fixing any identified errors.

4.2.1 OUTPUT DESIGN

Output design involves creating necessary outputs tailored to meet the requirements of various users. It is essential to approach the design of computer outputs in a well-considered manner. Outputs refer to any information generated by the information system, whether in printed or displayed form. Analysts design computer outputs by identifying specific outputs required to fulfill system requirements.

Computers serve as crucial sources of information for users. Efficient and thoughtful output design enhances the system's interaction with users and supports decision-making processes. When designing outputs, system analysts must achieve the following objectives:

- Determine the information to be presented
- Decide whether to display, print, or verbally communicate the information, and select the appropriate output medium
- Format the information in an easily understandable manner

Output design is critical to the success of any system as it bridges the gap between the user and the system's operations. Effective output design includes specifications and procedures for presenting data clearly to users. Users should never be left uncertain about system activities, as appropriate error messages and acknowledgment messages are provided.

4.2.3 CODE DESIGN

The coding phase transforms the detailed software design into a programming language. It translates the software's detailed design representation into executable code. Code design aims to minimize the lines of code used while modularizing the implementation. Modules hide complexity by encapsulating executable statements under named functions or procedures. Effective information hiding enhances program understanding at higher abstraction levels. Module names should accurately describe their actions to avoid confusion.

In this software, a modularized approach is employed with different functions created for various operations, each named to reflect its action.

4.2.4 DATABASE DESIGN

Database design identifies relevant data relationships and defines tables using standard methods. Each table's attributes are carefully defined to optimize database performance, ensure data integrity, minimize redundancy, and enhance security.

A database system is a computer representation of an information system designed to handle integrated data efficiently. It minimizes redundancy to provide quick, flexible, and cost-effective information access. Database design considers several specific objectives:

- Controlled redundancy
- User-friendly interface
- Data independence
- Cost-effective data retrieval
- Accuracy and integrity
- Failure recovery
- Privacy and security
- Performance optimization

Database design involves creating multiple views of data, including logical and physical views. The logical view represents data independently of its storage, focusing on how users and programmers interact with it. The physical view describes how data are stored and accessed in physical storage.

Each table in the database typically includes a primary key, a unique column (or combination of columns) that uniquely identifies each record. Primary keys ensure data integrity by enforcing uniqueness and cannot contain null values.

Normalization is employed to organize database data, minimizing redundancy and anomalies during data insertion, update, and deletion operations.

4.3 SYSTEM ARCHITECTURE AND PROCESS FLOW

UML DIAGRAMS

4.3.1 USE CASES

REGISTRATION

Use Case Id:	CL_UC_01
Use Case Name:	Registration
Created by:	Derin & Sheethal
Date Created:	20-07-2024
Description:	Allows new users to register for an account on the platform.
Primary actor:	User
Secondary actor:	None
Precondition:	User navigates to the registration page
Postcondition:	User account is successfully created.
Main flow:	1. User navigates to the registration page. 2. User provides required details: first name,last name, email, phone no, and password. 3. User submits the registration form. 4. System validates the information and creates the user account. Use case ends.

LOGIN

Use Case Id:	CL_UC_02
Use Case Name:	Login
Created by:	Derin & Sheethal
Date Created:	24-06-2024
Description:	This use case enables users to access the system by entering their credentials. There are two user roles: admin and customer. The admin logs in using their admin email and password, while the customer uses their own email and password. Once logged in, customers can purchase, and admins can add or edit items on the website.
Primary actor:	User/admin
Secondary actor:	None
Precondition:	The user should have a valid account.
Postcondition:	The system displays relevant homepage.
Main flow:	1. The user goes to the login page. 2. The user inputs their registered email and password. 3. The user submits the login form. 4. The system checks the user's credentials. 5. If the credentials are correct, the system grants the user access. 6. The use case concludes.

VIEW PRODUCTS

Use Case Id:	CL_UC_03
Use Case Name:	View Product
Created by:	Derin & Sheethal
Date Created:	24-06-2024
Description:	This use case allows users to view details of products available on the platform. Both admins and customers can browse products. Admins can see options to edit product details, while customers can see product descriptions, prices, and availability.
Primary actor:	User/admin
Secondary actor:	None
Precondition:	The user should be logged into their account.
Postcondition:	The system displays the detailed information of the selected product.
Main flow:	1. The user navigates to the product catalog page. 2. The user selects a product they wish to view. 3. The system retrieves the product details. 4. The system displays the product details, including description, price, and availability. 5. If the user is an admin, they also see options to edit the product details. 6. The use case concludes.

PURCHASE PRODUCT

Use Case Id:	CL_UC_04
Use Case Name:	Purchase Product
Created by:	Derin & Sheethal
Date Created:	24-06-2024
Description:	This use case allows customers to purchase products from the platform. Customers select products, proceed to checkout, and complete the payment process.
Primary actor:	User
Secondary actor:	None
Precondition:	The customer must be logged into their account and have selected items to purchase.
Postcondition:	The system confirms the purchase, updates the order status, and processes the payment.
Main flow:	1. The customer navigates to the product catalog and selects the items they wish to purchase. 2. The customer adds the selected items to their shopping cart. 3. The customer proceeds to the checkout page. 4. The system displays the order summary and prompts the customer to enter payment information. 5. The customer enters their payment details and submits the payment. 6. The system processes the payment and updates the order status. 7. The system confirms the purchase and provides an order confirmation to the customer. 8. The use case concludes.

MANAGE PRODUCTS

Use Case Id:	CL_UC_05
Use Case Name:	Manage Products
Created by:	Derin & Sheethal
Date Created:	24-06-2024
Description:	This use case allows admins to manage products on the platform. Admins can add new products, edit existing product details, and remove products as needed. This functionality ensures that the product catalog remains up-to-date and accurate.
Primary actor:	Admin
Secondary actor:	None
Precondition:	The admin must be logged into their account with appropriate privileges.
Postcondition:	The product catalog is updated with the new, edited, or removed product details.
Main flow:	1. The admin navigates to the product management page. 2. The admin selects an option to add, edit, or remove a product. • To add a Product: 1. The admin enters the product details, including name, description, price, and availability. 2. The admin submits the new product information. 3. The system updates the product catalog with the new product.

	• To Edit a Product: 1. The admin selects the product to be edited from the catalog. 2. The admin modifies the product details as needed. 3. The admin submits the updated product information. 4. The system updates the product catalog with the edited product details. • To Remove a Product: 1. The admin selects the product to be removed from the catalog. 2. The admin confirms the removal. 3. The system removes the product from the catalog. 3. The system confirms the action (add, edit, or remove) and updates the product catalog accordingly. The use case concludes.
--	---

BOOKING CONSULTATION AND SERVICES

Use Case Id:	CL_UC_07
Use Case Name:	Book Consultation and Services
Created by:	Derin & Sheethal
Date Created:	24-06-2024
Description:	This use case allows users to book consultations or services offered on the platform. Users can select the type of consultation or service, choose a suitable time slot, and confirm their booking. The system manages and schedules the bookings.
Primary actor:	User
Secondary actor:	None
Precondition:	The user must be logged into their account and have access to available consultations or services.
Postcondition:	The booking is confirmed, and the system updates the schedule with the new appointment.
Main flow:	1. The user navigates to the consultations or services booking page. 2. The user selects the type of consultation or service they wish to book. 3. The user chooses a preferred time slot from the available options. 4. The user provides any additional required information (e.g., details about the consultation or service). 5. The user submits the booking request. 6. The system updates the schedule and sends a confirmation to the user. 7. The use case concludes.

MANAGE BOOKING AND CONSULTATION

Use Case Id:	CL_UC_08
Use Case Name:	Manage Booking and Consultation
Created by:	Derin & Sheethal
Date Created:	24-06-2024
Description:	This use case allows admins or service providers to manage bookings and consultations on the platform. They can review, approve, modify, or cancel bookings and consultations to ensure smooth scheduling and service delivery.
Primary actor:	Admin
Secondary actor:	None
Precondition:	The admin or service provider must be logged into their account with appropriate privileges.
Postcondition:	The booking and consultation details are updated as per the actions taken (approved, or canceled).
Main flow:	i. The admin or service provider navigates to the booking and consultation management page. ii. The admin or service provider reviews the list of upcoming and pending bookings and consultations iii. The admin or service provider selects a booking or consultation to manage. • To Approve a Booking/consultation: 1. The admin or service provider reviews the booking details.

	2. The admin or service provider approves the booking or consultation. 3. The system updates the status of the booking or consultation to "Accepted" and sends a confirmation to the user. • To Cancel a Booking/Consultation: 1. The admin or service provider selects the booking or consultation to be canceled. 2. The admin or service provider confirms the cancellation. 3. The system updates the status to "Canceled" and sends a cancellation notice to the user. iv. The system confirms the action (accept, or cancel) and updates the booking and consultation records accordingly. v. The use case concludes.
--	--

LOG OUT

Use Case Id:	CL_UC_10
Use Case Name:	Log Out
Created by:	Derin & Sheethal
Date Created:	24-06-2024
Description:	This use case allows both users and admins to log out of their accounts on the platform. Logging out ensures that the session is securely ended, and access is restricted until the user or admin logs in again.
Primary actor:	User/Admin
Secondary actor:	None
Precondition:	The user or admin must be logged into their account.
Postcondition:	The user or admin must be logged into their account.
Main flow:	1. The user or admin navigates to the log out option. 2. The user or admin selects the option to log out. 3. The system terminates the session of the user or admin. 4. The system redirects the user or admin to the login page. 5. The system confirms that the user or admin has been successfully logged out. 6. Use case ends.

ADMIN SIDE

USER SIDE

4.4 MODULE DETAILS

There are five main modules in this website:

- **Login Module**
- **Sign-Up Module**
- **Product Discovery Module**
- **Consultation Booking Module**
- **Admin Dashboard Module**

1. Login Module

The login module allows registered users and administrators to securely access the Celestia website. It verifies user credentials (email and password) to grant access to personalized services such as browsing designs, purchasing products, and managing consultations.

2. Sign Up Module

The sign-up module enables new users to create accounts on Celestia. Users provide personal details including name, email, phone number, and password to register and access features like saving favorite designs, tracking orders, and booking consultations.

3. Product Discovery Module

The product discovery module allows users to explore trendy design ideas and browse products offered on Celestia. Users can view detailed product information, and add items to their shopping cart for purchase.

4. Consultation Booking Module

The consultation booking module enables users to schedule virtual or in-person consultations with design experts through Celestia and receive confirmation of their consultation bookings.

5. Admin Dashboard Module

The admin dashboard module provides administrators with tools to oversee consultation schedules, update website content. Admins can ensure smooth platform operation and maintain data integrity.

4.5 PERFORMANCE CONSIDERATIONS

Hardware Requirements

The system is designed to perform optimally with a minimum of 4GB RAM and is compatible with Windows OS versions and higher.

4.6 SECURITY CONSIDERATIONS

Access Control

- **Authorized Access:** Only users with valid usernames and passwords are allowed to access the Celestia Interior and Exterior Design platform.
- **Login Security:** The login process includes robust security measures to authenticate users and prevent unauthorized access.

4.7 TABLE DESIGN

1.Table name: user

Sl.no	Field Name	Data Type	Constraint	Description
1.	uid	int(11)	Primary Key, Auto_increment, Not null	User id
2.	ufname	varchar(20)	Not null	First name of the user
3.	ulname	varchar(20)	Not null	Last name of the user
4.	uphone	bigint(10)	Unique Key, Not null	Phone number of the user
5.	upass	varchar(255)	Not null	Password of the user
6.	udob	date	Not null	Date of birth of the user

7.	uemail	varchar(100)	Unique Key, Not null	Email of the user
8.	role	Int(11)	Default 2	Role specifying user or admin

3.Table name: products

Sl.no	Field Name	Data Type	Constraint	Description
1.	pid	int(11)	Primary key, Auto_increment, Not null	Product id
2.	pname	varchar(255)	Not null	Product name
3.	price	decimal	Not null	Product price
4.	pimage	varchar(255)	Not null	Product image
5.	deleted	tinyint(1)	Yes, Default 0	Shows whether deleted or not

4.Table name: consultations

Sl.no	Field Name	Data Type	Constraint	Description
1.	id	int(11)	Primary key, Auto_increment, Not null	Consultation id
2.	name	int(11)	Foreign key, Not null	User id from user table
3.	email	varchar(255)	Not null	Type of designer
4.	phone	varchar(20)	Not null	Phone no. of user
5.	consultation_type	Enum('in_person','virtual')	Not null	Type of consultation
6.	preferred_date	date	Not null	Date of consultation
7.	Preferred_Time	time	Not null	Time of consultation
8.	status	enum	Yes null	Status of consultation

9.	Created_at	timestamp	Not null	Time of creation
----	------------	-----------	----------	------------------

5.Table name: orders

Sl.no	Field Name	Data Type	Constraint	Description
1.	Order_id	int(11)	Primary key, Auto_increment, Not null	Order id
2.	User_id	int(11)	Foreign key, Not null	User id from user table
3.	Product_id	Int(11)	Foreign Key, Not null	Product id from products table
4.	quantity	Int(11)	Not null	Quantity of products
5.	Order_Date	datetime	Yes null, Current_Time	Date and time ordered
6.	status	Varchar(50)	Not null	Status of order

6.Table name: bank

Sl.no	Field Name	Data Type	Constraint	Description
1.	bid	int(11)	Primary key, Auto_increment, Not null	Bank id
2.	cvv	int(3)	Not null	CVV number of card
3.	bno	Bigint(!1)	Not null	Bank Account Number
4.	bbal	int(10)	Not null	Bank Account balance

7.Table name: accountholder

Sl.no	Field Name	Data Type	Constraint	Description
1.	holder_id	int(11)	Primary key, Auto_increment, Not null	Bank Account holder id
2.	bid	Int(11)	Default null	Bank id foreign key from bank table
3.	bfname	Varchar(255)	Default null	Accunt holder first name
4.	blname	Varchar(255)	Default null	Account holder last name

7.Table name: bookings

Sl.no	Field Name	Data Type	Constraint	Description
1.	Booking_id	int(11)	Primary key, Auto_increment, Not null	Booking id of service
2.	Userid	int(11)	Foreign key, Not null	User id from user table
3.	Service_name	Varchar(255)	Not null	Service name
4.	Customer_name	Varchar(255)	Not null	Name of customer
5.	Customer_email	Varchar(255)	Not null	Email of customer
6.	Book_date	date	Not null	Booking date
7.	Created_at	timestamp	Not null, Default current_timestamp()	Time of booking
8.	status	enum	Not null, Default pending	Status of booking

8.Table name: cart

Sl.no	Field Name	Data Type	Constraint	Description
1.	cid	int(11)	Primary key, Auto_increment, Not null	Cart id
2.	pid	Int(11)	Not null	Product id foreign key from products table
3.	uid	Int(11)	Not null	User id foreign key from user table
4.	price	Decimal(10,2)	Not null	Price of product
5.	quantity	Int(2)	Not null, Default 1	Quantity of product

9.Table name: contact

Sl.no	Field Name	Data Type	Constraint	Description
1.	id	int(11)	Primary key, Auto_increment, Not null	Contact id
2.	name	Varchar(255)	Not null	Name of the customer
3.	email	Varchar(255)	Not null	Customer email
4.	message	text	Not null	Contact message
5.	status	Enum('unread','read')	Yes null, Default unread	Status of message
6.	Date_Rcieved	timestamp	Not null. Default current_timestamp()	Date message receieved

CODING

5.CODING

5.1 INTRODUCTION

Coding section is where the magic happens. All the planning and the designing done in the previous sections come to life in this section. After this section can only the programmer enjoy the result of his/her hard work when he/she runs the program for the first time.

5.2 SELECTION OF SOFTWARE

PHP

PHP, an acronym for Hypertext Preprocessor, is a versatile server-side scripting language that falls under the broader category of software development. It is widely recognized for its pivotal role in web development and boasts several essential features that make it a preferred choice for building dynamic websites and web applications. Here are some of its key features:

- Open Source
- Database Integration
- Embedded in HTML
- Cross-Platform Compatibility
- Security

MYSQL

MySQL is an open-source relational database system, widely used for web development task like data storage, manipulation, and retrieval. It seamlessly integrates into web applications, eliminating the need for complex setup. MySQL is embedded within web development environments, making administrative tasks effortless. It operates as an SQL-based database, storing data in text files on the device. Unlike systems like JDBC, MySQL simplifies data access with its broad range of relational database features. Its features are

- Zero configuration
- Server less
- Stable cross platform database file

- Less memory
- Self-contained
- Transactional

5.3 CODING PHASE

The goal of the coding or programming phase is to translate the design of the system produced during the design phase into code in a given programming language, which can be executed by a computer and that performs the computation specified by the design. The coding phase affects both testing and maintenance profoundly.

The coding phase does not affect the structure of the system; it has great impact on the internal structure of modules, which affects the testability of the system. The goal of the coding phase is to produce clear simple programs. The aim is not to reduce the coding effect, but to program in a manner so that testing and maintenance costs are reduced.

Programs should not be constructed so that they are easy to write; they should be easy to read and understand. Reading programs is a much more common activity than writing programs. Hence, the goal of the coding phase is to produce simple programs that are clear to understand and modify.

5.3.1 CODING STANDARDS

The standard used in the development of the system is Microsoft Programming standards. It includes naming conventions of variables, constants and objects, standardized formats for labelling and commenting code, spacing, formatting and indenting.

Naming Conventions

The controls are prefixed to indicate their functions. The frames are prefixed with frm, textboxes are prefixed with txt, command buttons with cmd, label boxes with lbl, list boxes with lst, comboboxes with cmb, Date Time Pickers with DTP, Grid with grid and so on.

Labels and Comments

The functions of each control are labelled clearly in the GUI. The code also includes comments so that other developers using the source code in future might understand the module functions better.

TESTING & IMPLEMENTATION

6. TESTING

6.1 INTRODUCTION

Software testing is a critical element of software quality assurance and represents the ultimate review of specifications design and coding. Testing presents an interesting anomaly for the software. Testing is a quality measure process, which reveals the errors in the program. During testing, the program is executed with a set of test cases and the output of the program for the test cases is evaluated to determine if the program is performing as it is expected. Testing plays a very critical role in determining the reliability and efficiency of the software and it is a very important stage in software development.

6.2 TESTING

System testing is actually a series of different tests whose primary purpose is to fully exercise the computer-based systems. Although each test has a different purpose, all work to verify that all system elements have been properly integrated and perform allocated functions.

System testing is done in order to ensure that the system developed doesn't fail at any point. Before implementations, the system is tested with experimental data to ensure that it will meet the specified requirements, special tests data are input for processing and results examined.

6.2.1 TEST PLAN

Preparation of test data

Taking various kinds of test data does the testing. Preparation of test data plays a vital role in the system testing. After preparing, the test data the system under study is tested using that test data. While testing the system by using test data errors are again uncovered and corrected by using above testing steps and correction are also noted for future use. Two kinds of test data were collected and used:

Using live test data

Live test is those that are actually extracted from organization files. After a system is partially constructed, programmers or analyst often ask users to key in a set of data from their normal activities. Then, the system person uses this data as a way to partially test the

system. In order instance, programmers or analysts extract a set of live data from the files and have entered themselves.

Using artificial test data

Artificial test data are created solely for test purpose, since they can be generated to test all combinations of formats and values. In other words, the artificial data, which can quickly be prepared by a data generating utility program in the information system department, make possible the testing of all login and control paths through the program.

The most effective test program uses artificial test data generated by person other than those who wrote the program.

In this project invalid data was entered to test whether the program would break or not. These invalid data entries were randomly generated using random people. Many people were given the software for testing the program. They use gibberish values to test if every validation holds strong.

6.3 TESTING METHODS

Testing is generally done at two levels-testing of individual modules and testing of the entire system. During system testing, the system is used experimentally to ensure that the software does not fail that is, that it will run according to its specifications and the results examined. A limited number of uses may be allowed to use the system so analysis can see whether they use it in unforeseen ways. It is preferable to discover any surprise before the organization implements the system and depends on it.

Testing is done throughout system development at various stages. It is always a good practice to test the system at many different levels at various intervals, that is, sub systems, program modules as work progresses and finally the system as a whole. During testing the major activities are concentrated on the examination and modification of the source code. Usually, this testing is to be performed by the person other than the person who has really coded it. This is done in order to ensure more complete and unbiased testing for making the software more reliable.

There are two types of testing:

- Black box testing

- White box testing

6.3.1 WHITE BOX TESTING

In white box testing, the internal logic of the modules is considered. Following levels of testing are performed for the developed project:

6.3.1.1 Unit Testing

This involves the tests carried out on modules programs, which make up a system. This is also called as a program testing. The units in a large system many modules at different levels are needed. Unit testing focuses on the modules, independently of one another, to locate errors. The program should be tested for correctness of logic applied and should detect errors in coding. Before proceeding one must make sure that all the programs are working independently.

6.3.2 BLACK BOX TESTING

The concept of the black box is used to represent a system who's inside workings are not available for inspection. In a black box, the test item is treated as "black", since its logic is unknown; all that is known is what goes in and what comes out, or the input and output.

6.3.2.1 System Testing

The system testing is conducted on a complete, integrated system to evaluate the system's compliance with its specified requirement. It falls within scope of black box testing so no knowledge of inner design or logic is needed. As a rule, system testing takes, as its input, all of the integrated software components that have passed integration testing and also the software system itself integrated with any applicable hardware system. The purpose of the integration testing is to detect any inconsistencies between software units.

System testing is the stage of implementation, which is aimed at ensuring that the system works accurately and efficiently before live operation commence. The logical design and the physical design should be thoroughly and continually examined on paper ensure that they will work when implemented.

6.3.2.2 Integration Testing

Integration testing is a systematic technique for constructing the program structure, while at the same time conducting tests to uncover errors associated with interfacing. This is the program is constructed and tested in small segments, which makes it easier to isolate and the following common types of integration problems may be observed:

- Version mistakes
- Data integrity violations
- Overlapping function
- Resource problems especially in memory handling
- Wrong type of parameter in function calls

6.3.2.3 Validation Testing

At the culmination of the integration testing, the software was completely assembled as a package, interfacing errors have been uncovered and corrected and a final series of software validation testing began.

In validation testing we test the system functions in a manner that can be reasonably expected by customer, the system was tested against system requirement specification. Different unusual inputs that the users may use were assumed and the outputs were verified for such unprecedented inputs. Deviation or errors discovered at this step are corrected prior to the completion of this project with the help of user by negotiating to establish a method for resolving deficiencies. Thus, the proposed system under consideration has been tested by using validation testing and found to be working satisfactorily. Validation checking is performed on the: -

Numeric Field: - The numeric field can contain only numbers from 0 to 9. An entry of any character flashes an error message. The individual modules are checked for accuracy and what it has to perform. Each module is subjected to test run along with sample data. The individually tested module are integrated into a single system.

Character Field: - This field can only contain letters from A-Z and a-z. It is useful for name, address fields and so on.

Check Null Fields: - Before entering values into the database or when updating, a validation is done to check whether any NULL fields are present.

Email Fields: - A email only field with a limit of characters. All the necessary validation checks were verified to see if invalid data ever enters into the database. Null values in fields were also treated as invalid values.

Password Fields: - - A password only field with a limit of characters. All the necessary validation checks were verified to see if invalid data ever enters into the database. Null values in fields were also treated as invalid values.

6.3.3 OUTPUT TESTING

After performing validation test, the next phase is output test of the system, since no system could be useful if it does not produce the desired output in the desired format. By consideration the format of the report/output was generated or displayed and was tested. Here output format was considered in one way: on the display screen.

6.3.4 USER ACCEPTANCE TESTING

User acceptance test of a system is the key factor for the success of the system. The system under consideration was listed for user acceptance by keeping constant touch with the perspective user of the system at the time of design, development and making changes whenever required. This was done with the regards of the following points: -

- Input screen design
- Output design

Users from each of the 2 user types (Admin, user) were selected for user acceptance testing. The Admin was given the software for testing with his username and password. The admin actions are performed and see whether all details are entering into the database and working properly as expected... The customers side is tested using a customer name and password by registering to the system and see he can post property from the website .

6.4 IMPLEMENTATION

Implementation is the stage of the project when the theoretical design is turned into a working system. The implementation stage is a system project in its own right. It includes careful planning, investigation of current system and its constraints on implementation, design of methods to achieve the changeover, training of the staff in the changeover procedure and evaluation of the changeover method.

The first task in implementation is planning deciding on the methods and time scale to be adopted. Once the planning has been completed the major effort is to ensure that the programs in the system are working properly when the user has been trained.

The complete system involving both computer and user can be executed effectively. Thus, the clear plans are prepared for the activities.

Successful implementation of the new system design is a critical phase in the system life cycle. Implementation means the process of converting a new or a revised system design into an operational one.

MAINTENANCE & ENHANCEMENT

7. MAINTENANCE AND ENHANCEMENT

7.1 MAINTENANCE

This software can be modified as need occurs. Maintenance includes all the activities after installation of the software that is performed to keep the system operational. The process of maintenance involves:

- Understanding the existing software
- Understand the effect of change
- Test for satisfaction

This software requires little to no maintenance. During the testing phase most maintenance duties are performed. If a maintenance requirement occurs, it can be solved with ease

7.2 ENHANCEMENT

The Celestia website is built with a modular architecture, allowing for easy expansion and additional functionalities. As the business grows and customer demands evolve, the platform can seamlessly integrate new features to enhance the user experience.

Future enhancements to the Celestia website could include:

- **Virtual Design Consultation:** Integrate virtual design consultations using video conferencing tools, allowing clients to discuss their requirements with designers directly from the platform.
- **3D Landscape Visualization:** Offer customers 3D landscape modeling for garden and interior designs, providing a detailed view of how the project will look before implementation.
- **Booking Reminder Alerts:** Implement SMS or email alerts for upcoming bookings, along with calendar integrations for scheduled appointments, helping customers stay informed.
- **Advanced Customer Profiles:** Implement a profile system where users can track their service history, view consultations, and manage upcoming bookings all from a personalized dashboard.

- **AR Home Design:** Implement Augmented Reality (AR) functionality that allows customers to visualize interior design changes or outdoor projects directly on their property using their mobile device camera.

These future developments will help enhance Celestia's service offerings, attract new customers, and provide a seamless, user-friendly experience that stays competitive as technology advances.

CONCLUSION

8. CONCLUSION

In today's dynamic design and landscaping industry, technology plays a pivotal role in shaping customer experiences and elevating service delivery. Traditional methods of offering landscaping, pool building, and interior design services are being transformed by innovative digital solutions. The Celestia website exemplifies this evolution, providing a seamless bridge between customers and service providers. With a user-friendly, interactive platform, Celestia harnesses modern web technologies to allow users to explore, book, and engage with services from the comfort of their homes, eliminating the barriers of traditional consultations.

The primary goal of Celestia has always been to empower customers with easy access to high-quality services in garden development, pool building, interior design, and more. Celestia streamlines service inquiries, enhances transparency, and fosters trust within the service community, setting new standards for customer interaction in the design and landscaping sectors.

As the industry continues to evolve, Celestia remains committed to further enhancements, embracing new technologies, and meeting the growing needs of its customers. Looking ahead, Celestia aims to continue revolutionizing service delivery by integrating technology and design services to create even more seamless and impactful customer experiences.

Our Services

From consultation to completion, we offer a range of services tailored to meet your needs. Whether you're looking for a fresh look for your home or a comprehensive design overhaul, Celestia has you covered.

Interior Design: Our interior design services transform your living spaces into stylish, functional areas that reflect your personal taste. We handle everything from conceptualization and space planning to selecting furnishings and decor.

Exterior Design: Enhance your property's outdoor spaces with our exterior design services. We specialize in creating beautiful, functional exteriors, including swimming pools, gardens, patios, and outdoor living areas that complement your home's architectural style.

Consultation Services: Not sure where to start? Our consultation services provide you with expert advice and guidance to help you make informed design decisions. We'll work with you to develop a design plan that aligns with your vision and goals.

At Celestia, we are dedicated to creating spaces that are uniquely yours, combining elegance, functionality, and comfort in every project we undertake.

Portfolio

Our portfolio showcases a diverse range of projects that highlight our expertise in both interior and exterior design. Each project is a testament to our commitment to quality, creativity, and client satisfaction. Explore our portfolio to see how we've transformed various spaces into stunning and functional environments.

Contact Us

Have a project in mind? Contact us today to discuss your design needs and let us help you create the space of your dreams.
